CHAPTER 1. INTRODUCTION	1-1
CHAPTER 2. ASTRONOMICAL TABLES AND CHARTS	2-1
Table 1a. Astronomic refraction corrected for temperature (degrees)	2-1
1b. Astronomic refraction corrected for temperature (mils)	2-5
1c. Pressure correction factor C_b	2-8
2. Sun, 1982, for zero hours universal time (GMT)	2-9
3. Equation of time graph	2-21
4. Correction to Greenwich mean time interval to obtain Greenwich sidereal time interval	2-22
5a. Conversion of time to arc	2-24
5b. Conversion of arc to time	2-25
5c. Conversion of degrees, minutes, and seconds to mils	2-26
6. Convergence	2-27
6a. Grid convergence nomograph	2-40
7. Second term in convergence computation, UTM coordinates	2-41
8a. Second term in convergence computation, geographic coordinates (degrees)	2-43
8b. Second term in convergence computation, geographic coordinates (mils)	2-44
9. Alphabetical star list	2-45
10a. Apparent places of stars, 1982 (degrees)	2-47
10b. Apparent places of stars, 1982 (mils of declination)	2-51
11. Apparent places of Polaris (star no. 10), 1982	2-55
12. To determine azimuth from Polaris, 1982	2-56
13. Grid azimuth correction, simultaneous observation	2-61
14. Zone-to-zone azimuth transformation	2-62

CHAPTER 1

INTRODUCTION

1-1. Purpose and Scope

a. This manual is a compilation of tables and charts for use in computing astronomical azimuths for the field artillery. These tables and charts are used for computing azimuth of the Sun or selected stars by either the altitude or hour-angle method. A special table (table 12), which is a tabular method of computing Polaris, is included for a rapid computation of a Polaris azimuth. The secant tables accompanying table 12 are permanent; however, the example portion of the explanatory part of the table will be updated annually. Tables and charts are also included to correct astronomic azimuth to grid azimuth, to extend azimuth by simultaneous observation and to perform zone-to-zone transformation of azimuth.

b. Data contained in tables 2, 10a, 10b, 11, and 12 are current only for the year in which the manual is effective. These tables are compiled annually by the Counterfire Department, under the supervision of the NOAA Liaison Officer, US Army Field Artillery School. The basic astronomical data is furnished by H.M. Nautical Almanac

Office, Royal Greenwich Observatory, and the Nautical Almanac Office, US Naval Observatory.

c. Users of this manual are encouraged to submit recommended changes or comments to improve the manual. Comments should be keyed to the specific page, paragraph, and line of the text in which the change is recommended. Reasons should be provided for each comment to insure understanding and complete evaluation. Comments should be prepared using DA Form 2028 (Recommended Changes to Publications and Blank Forms) and forwarded direct to the Commandant, US Army Field Artillery School, ATTN: ATSF-TD-TL, Fort Sill, Oklahoma 73503.

1-2. Description of Tables and Charts

This manual is intended to be used as a companion publication to FM 6-2, *Field Artillery Survey*. Details on the computation of astronomical azimuth and the use of these tables and charts are contained in FM 6-2.

EQUATION OF TIME—PARTIAL DAY IN SECONDS

(Use sign of daily change.)

Note. Enter table with value of daily change to the nearest second and of GMT to the nearest 10 minutes. Do *not* interpolate for values more accurate than the nearest second.

Example: Time is 22 hours , 46 minutes, 37 seconds. Convert to arc.

22 hours time = 330° arc

46 minutes time = 11° 30' arc

37 seconds time = 9' 15" arc

22h 46M 37S 341° 39' 15" arc

Table 6. Convergence

Northing = UTM grid northing coordinate of station in meters.
 If in Northern Hemisphere, enter table with northing.
 If in Southern Hemisphere, subtract northing of station from 10,000,000; enter table with resulting northing.
 Enter table using northing to nearest 100 meters and interpolate.
 Log XV = Log of function XV (sign always +).

(Octantis), Nu (ν) Octantis***	Octans	69	3.7
Peacock, Alpha (α) Pavonis	Pavo	67	2.1
Phecda, Gamma (γ) Ursae Majoris*	Ursa Major	40	2.5
Polaris, Alpha (α) Ursae Minoris***	Ursa Minor	10	2.1
Pollux, Beta (β) Geminorum	Gemini	30	1.2
Procyon, Alpha (α) Canis Minoris	Canis Minor	29	0.5
Rasalhague, Alpha (α) Ophiuchi	Ophiuchus	61	2.1
Regulus, Alpha (α) Leonis	Leo	36	1.3
Rigel, Beta (β) Orionis	Orion	16	0.3
Rigil Kentaurus, Alpha (α) Centauri	Centaurus	52	0.1
Ruchbah, Delta (δ) Cassiopeiae*	Cassiopeia	8	2.8
Sabik, Eta (η) Ophiuchi	Ophiuchus	59	2.6
Scaula, (Shaula), Lambda (λ) Scorpii	Scorpius	60	1.7
Schedar, (Schedir), Alpha (α) Cassiopeiae	Cassiopeia	5	2.3
Sirius, Alpha (α) Canis Majoris	Canis Major	25	-1.6
Spica, Alpha (α) Virginis	Virgo	47	1.2
Suhail, (Al Suhail), Lambda (λ) Velorum	Vela (Argo)	33	2.2
Theta (θ) Centauri, Menkent	Centaurus	50	2.3
Vega, Alpha (α) Lyrae	Lyra	64	0.1
Wezen, Delta (δ) Canis Majoris*	Canis Major	27	2.0
Zeta (ζ) Orionis, Alnitak*	Orion	21	2.0
Zebenelgenubi, Alpha (α) Librae**	Libra	53	2.9

Note. Sirius (magnitude—1.6) is the brightest star listed, Octantis (magnitude 3.7 is the dimmest star listed. Brightness of other stars listed is indicated by their magnitude.

Spelled out names in parentheses are names sometimes used but not recommended.

*Indicates star not on identifier 2012D.

**Indicates star not on identifier 2012C.

***Indicates star not on either identifier.

The constellation Argus has been replaced by its three modern divisions carina, Puppis, and Vela.

Table 12. To Determine Azimuth from Polaris

PURPOSE: The purpose of this table is to provide a fast, simple method of determining 5th order azimuths from observations of Polaris. When the appropriate secant table (following) is used, use of logarithms is unnecessary.

GUIDE FOR USE:

1. Determine local sidereal time (LST) of observation as described in FM 6-2.
2. Enter the table with this LST and extract the corresponding b_0 , b_1 , and b_2 .
3. Algebraically add b_0 , b_1 , and b_2 .
4. Select the appropriate secant table depending whether the results are to be in minutes of arc or mils. It is advisable to "X" out the secant table that will not be used. Using degrees of latitude, extract the corresponding secant and DIFF 1' OF LAT. ($\times 100000$). Round the minutes and seconds of latitude to the nearest whole minute; multiply this by the DIFF 1'; round to the nearest 10; move the decimal five places to the left; and add the result to the secant.
5. Multiply the result of 4 above by the sum of $b_0 + b_1 + b_2$ and round to the nearest 0.1; this, with the sign of $b_0 + b_1 + b_2$, is the azimuth angle.
6. Add the azimuth angle algebraically to 6400 mils (or 360 degrees) to get the azimuth to Polaris. Subtract the mean horizontal angle (clockwise, from azimuth mark to Polaris) from the azimuth to Polaris to get the azimuth to the mark. If the azimuth to the mark exceeds 6400, subtract 6400.

EXAMPLE:

Required: Astronomic azimuth

Known: LST of observation = 5 hr 27 min

Latitude = $34^\circ 37' 45''$

Month = May 1976

Mean horizontal angle from mark to Polaris = 1320.5 m

From TABLE 12, 1976: $b_0 = -38.8$, $b_1 = +.2$, $b_2 = -.3$

$b_0 + b_1 + b_2 = (-38.8) + (+.2) + (-.3) = -38.9$

Results are needed in mils so the SECANT TABLE,
Results in Mils, is used.

DEGREES LATITUDE	SECANT ($\times \text{m conv.}$)	DIFF. 1' OF LAT. ($\times 100000$)
34	0.3574	7.2

Minutes and seconds of latitude rounded to nearest whole minute = 38;
 $38 \times 7.2 = 273.6$; rounding to nearest 10 yields 270; moving the decimal
five places to the left yields .0027; $0.3574 + .0027 = 0.3601$

$-38.9 \times 0.3601 = -14.00789$; rounded to the nearest 0.1 m , this yields

AZIMUTH ANGLE = -14.0 m

AZIMUTH TO MARK = $-14.0 + 6400 - 1320.5 = 5065.5 \text{ m}$

$$\frac{(b_0 + b_1 + b_2)}{\cos \text{LATITUDE}}$$
 AZIMUTH OF POLARIS

Table 13. Grid Azimuth Correction, Simultaneous Observation

Table 14. Zone to Zone Azimuth Transformation Table

PURPOSE: The purpose of this table is to provide a method for the conversion of UTM grid azimuths in one zone into the corresponding azimuths at an adjacent zone. The table is designed for use in the area between the respective central meridians of the adjacent zones; however, it will yield accurate results a moderate distance outside this area. Results are in mils.

GUIDE FOR USE:

1. Coordinates must be transformed to the adjacent zone by use of TM 5-241-2 or other means.
2. The northing coordinates in each zone are added together. This "total northing" (N) is rounded to the nearest 100 (4th order) or 1000 (5th order). In the Southern Hemisphere the total N must be subtracted from 20,000,000 before entering the table.
3. Find the tabulated Ns between which the total N lies, subtract the lower tabulated N from the total N and move the decimal five places to the left.
4. Multiply this by the "DIFF IN C" located opposite the lower tabulated N.
5. Add this product to the "C" opposite the lower tabulated value. In 5th order computations, this is the change in azimuth; 4th order accuracy requires the following steps.
6. Subtract the smaller of the 2 Ns of the point from the larger, round to the nearest 100, and move the decimal three places to the left. If the resulting number is smaller than the "ALLOWABLE DIFF IN N" opposite the lower tabulated N, no further computations are required and the result from 5 above is the correct change in azimuth. If it is larger, complete the following steps.
7. Square the computed number.
8. Extract from the table the F closest the total N, multiply it by the squared number, round to nearest whole number and move the decimal three places to the left.
9. Add the resulting number to the result of 5 above. The sum is the change in azimuth.
10. The sign of the change in azimuth is determined by use of the following chart:

When the point is transformed from:

(Northern Hemisphere)	(Southern Hemisphere)
East to West, sign is -	East to West, sign is +
West to East, sign is +	West to East, sign is -

Example of a 5th Order Accuracy:

Required: Change in azimuth (C) to nearest 0.1 m.

Known: N (Zone 15) = 3833384

N (Zone 14) = 3830861

$3833384 + 3830861 = 7664245$; round to 7664000, which lies between 7600000 and 7700000 in the table.

$7664000 - 7600000 = 64000$; moving the decimal five places to the left yields 0.64.

N	C	DIFF IN C
7 600 000	60.157	.691

$$C = 60.157 + (0.64 \times .691) = 60.157 + .442 = 60.599$$

Rounded to the nearest 0.1 m, C = 60.6 m

Example of a 4th Order Accuracy:

Required: Change in azimuth (C) to nearest 0.001 m.

Known: N (Zone 15) = 3834767

N (Zone 14) = 3830679

$3834767 + 3830679 = 7665446$; round to 7665400, which lies between 7600000 and 7700000 in the table.

$7665400 - 7600000 = 65400$; moving the decimal five places to the left yields 0.654.

N	C	DIFF IN C	ALLOWABLE DIFF IN N	F
7 600 000	60.157	.691	1.53	0.21
7 700 000			1.54	0.21

$$C = 60.157 + (0.654 \times .691) = 60.157 + .452 = 60.609 \text{ m}$$

$3834767 - 3830679 = 4088$; rounding to the nearest 100 and moving the decimal three places to the left yields 4.1, which is larger than the closest ALLOWABLE DIFF IN N (1.54). Therefore, further computations are required.

$4.1 \text{ squared} = 4.1 \times 4.1 = 16.8$; $16.8 \times F = 16.8 \times 0.21 = 3.53$; rounding to the nearest whole number and moving the decimal three places to the left yields .004.

$$C = 60.609 + .004 = 60.613 \text{ m}$$
